

LBCode.IA — Internal Google Ads Reporting Tool

Design Document — Google Ads API Basic Access Application

Company: LBCode.IA (Santarem, PA, Brazil) | Contact: lbcodeia@gmail.com | MCC: 736-729-5825

1. Purpose and Overview

LBCode.IA is a digital solutions agency that builds custom software (ERPs, CRMs, AI automations and internal dashboards) for small and medium businesses, and manages Google Ads and Meta Ads accounts for itself and its clients. This tool is a strictly **internal, read-mostly reporting and account-hygiene tool** used by the agency's staff to generate performance reports and keyword recommendations for the accounts managed under our MCC (736-729-5825).

The tool is **not** a commercial product, is not resold, has no public access, and does not expose the API to third parties.

2. Users and Access

- Internal users only: LBCode.IA staff (currently 1 operator).
- The tool runs locally as command-line Python scripts on company machines; there is no public web endpoint.
- OAuth 2.0 credentials (desktop application flow) are tied to the agency's own Google account, which has manager access to all client accounts through the MCC.
- Credentials are stored locally in a configuration file excluded from version control.

3. Functionality

3.1 Performance Dashboard (read-only). Pulls campaign, ad group, ad and keyword performance metrics (impressions, clicks, cost, conversions, CTR, CPC) for a selected date range and renders a static HTML report reviewed internally and shared with the account's owner (our client) as a document.

3.2 Search Terms / Negative Keyword Analysis (read-only). Queries `search_term_view` to identify wasted spend and produces a recommended negative keyword list. Recommendations are applied manually by staff in the Google Ads UI.

3.3 Cross-platform Summary (read-only). Merges Google Ads metrics with Meta Ads metrics (retrieved separately via Meta's API) into a single internal HTML report.

4. Architecture and Data Flow

Components: local Python scripts → official google-ads Python client library → Google Ads API (GoogleAdsService.SearchStream, GAQL) → HTML report generator.

Flow: (1) operator runs a script specifying client account and date range; (2) script authenticates via OAuth 2.0 refresh token with login-customer-id set to our MCC; (3) GAQL queries retrieve reporting rows; (4) results are aggregated in memory and written to a local HTML file; (5) no raw API data is stored in databases or transmitted to external services.

5. API Services and Estimated Usage

API Service	Purpose	Est. volume
GoogleAdsService.SearchStream (GAQL)	campaign / ad_group / ad / keyword / search_term_view-reports	50-200 requests/day
CustomerService	list accessible customers (setup only)	< 5 requests/day

Reports are run on demand (typically weekly per account). Expected total volume is far below Basic Access daily operation limits. No mutate operations are performed today; if account-management features (e.g., pausing ads) are added later, every mutate will require explicit human confirmation and will be logged to a local audit file.

6. Data Storage, Privacy and Security

- API responses are processed in memory; only aggregated metrics are written into generated HTML reports stored locally.
- No Google Ads data is sold, shared with third parties, or used for purposes other than reporting to the account owner.
- Developer token, OAuth client credentials and refresh token are stored in a local, git-ignored configuration file with filesystem permissions restricted to the operator.
- Required Minimum Functionality (RMF) does not apply, as the tool is internal-only and non-commercial.

7. Sample Output (report structure)

Generated HTML dashboards contain: executive summary (spend, conversions, CPA, period-over-period deltas); campaign table; ad group and ad breakdowns; keyword performance and search-term waste analysis; recommendations section written by staff.

Example header of a generated report:

Google Ads Dashboard — <Client>
Period: 2026-06-05 -> 2026-07-04 Customer ID: xxx-xxx-xxxx
Spend R\$ x.xxx Clicks x.xxx Conv. xx CPA R\$ xx
